Wireless Warehouse: SCAN

ConnectData's Wireless Warehouse Software (WW) has been used successfully by more than 100 companies for almost two decades.

The software is server-based and controls the communication with all mobile scanners in the company on the one hand, and on the other hand it is closely connected to the ERP system of the companies and transfers accounting relevant data to it.

Modifications to the ERP system are not necessary when using Wireless Warehouse - ERP is always the leading system for master and transaction data.

With WW, you control and support the entire material flow in your company and significantly reduce both the error rates and the time required for internal transport.

Scan and Print Labels

Sanning and label printing under Wireless Warehouse is very simple and uses the common standard protocols and fonts.

An available WLAN network is indispensable for scanning. If required, ConnectData takes over the WLAN illumination and defines the required hardware for the access point.

We use Crystal Report as label printing software. We support all barcodes according to the standards UPC-A, UPC-E, EAN-8, EAN-13, EAN-14, JAN, ISBN and others. Prerequisite is the availability of the corresponding base code fonts,

As a scanner almost all scanable PDA devices can be used provided they have a Windows or Android operating system. We do not support IOS. Wireless Warehouse supports different display sizes either by a dynamic adjustment from the software or in individual cases by customizing the corresponding application. The scanners and printers are set up and tested by us before they are used by the customer
